

Assignment 2.1 - My First HTML Document

<!doctype html> : This tells the browser that the document is an HTML document and should be interpreted using modern HTML standards. It is called the **DOCTYPE declaration**.

<html> with a lang attribute: Your document needs an HTML root element with an appropriate language attribute. For an English page, the language would normally be English.
<html ...></html>

The **head <head></head>** contains information about the webpage rather than the main visible content of the webpage. The head can contain: Character encoding, Viewport information, Page title, CSS links, Other metadata.

<meta charset="utf-8"> : This tells the browser which character encoding the webpage uses. UTF-8 allows your webpage to correctly represent a very large range of characters and symbols.

<meta name="viewport"> : The viewport tells the browser how the webpage should behave in relation to the device's screen. This is particularly important for responsive web design.

<title></title> : The Title is the title of the webpage.

Term	Meaning
DOCTYPE	Tells the browser which HTML standard the document follows
HTML	The root element containing the webpage document
Head	Contains metadata and information about the page
Body	Contains the main visible webpage content
Title	Sets the document's title, usually shown in the browser tab
Element	A complete HTML building block
Tag	Markup used to create/identify an HTML element
Attribute	Extra information provided on an element
Nesting	Placing one element inside another
Void element	An element that doesn't have a closing tag or child content
